

*From atoms and molecules  
to new materials and technologies*

**Reduction of detailed kinetic mechanisms:  
Introduction to Mechanism Reduction Module for  
Chemical Workbench and best-practice**

July 22, 2014

# Overview of the webinar

1. About Kintech Lab
2. What is mechanism reduction and how it works?
3. **Demo:** working with Mechanism Reduction Module
4. Best practice recommendations for mechanism reduction
5. **Demo:** Setting reduction method parameters
6. **Demo:** Reducing mechanisms for a set of conditions
7. **Demo:** Application of several reduction methods

# About Kintech Lab

**KINTECH** was founded in 2001 by scientists and engineers from and the Russian Research Center "Kurchatov Institute" and Moscow State University

## Activity fields:

- ✓ Conducting of inventive research and consulting for a wide range of applications
- ✓ Software development for chemistry-intensive modeling and design in complete cycle
- ✓ Customer support in their own research activity using the advanced simulation capabilities of KINTECH's software

# About Kintech Lab

**Kintech Lab develops methods and special software tools for multilevel modeling in different engineering fields:**

- ✓ Chemical Workbench – an integrated environment for the development and reduction of chemical mechanisms
- ✓ Khimera – a unique tool for calculating microscopic parameters from first-principles calculations
- ✓ KintechDB – a network-based database for accumulation of Lab data on substances and processes
- ✓ FDTD-II – a tool for modeling the optical properties of metamaterials
- ✓ MD-kMC – an integrated environment for atomistic modeling
- ✓ EtchLab – a tool for modeling and optimization of MEMS fabrication

# What is mechanism reduction and how it works?

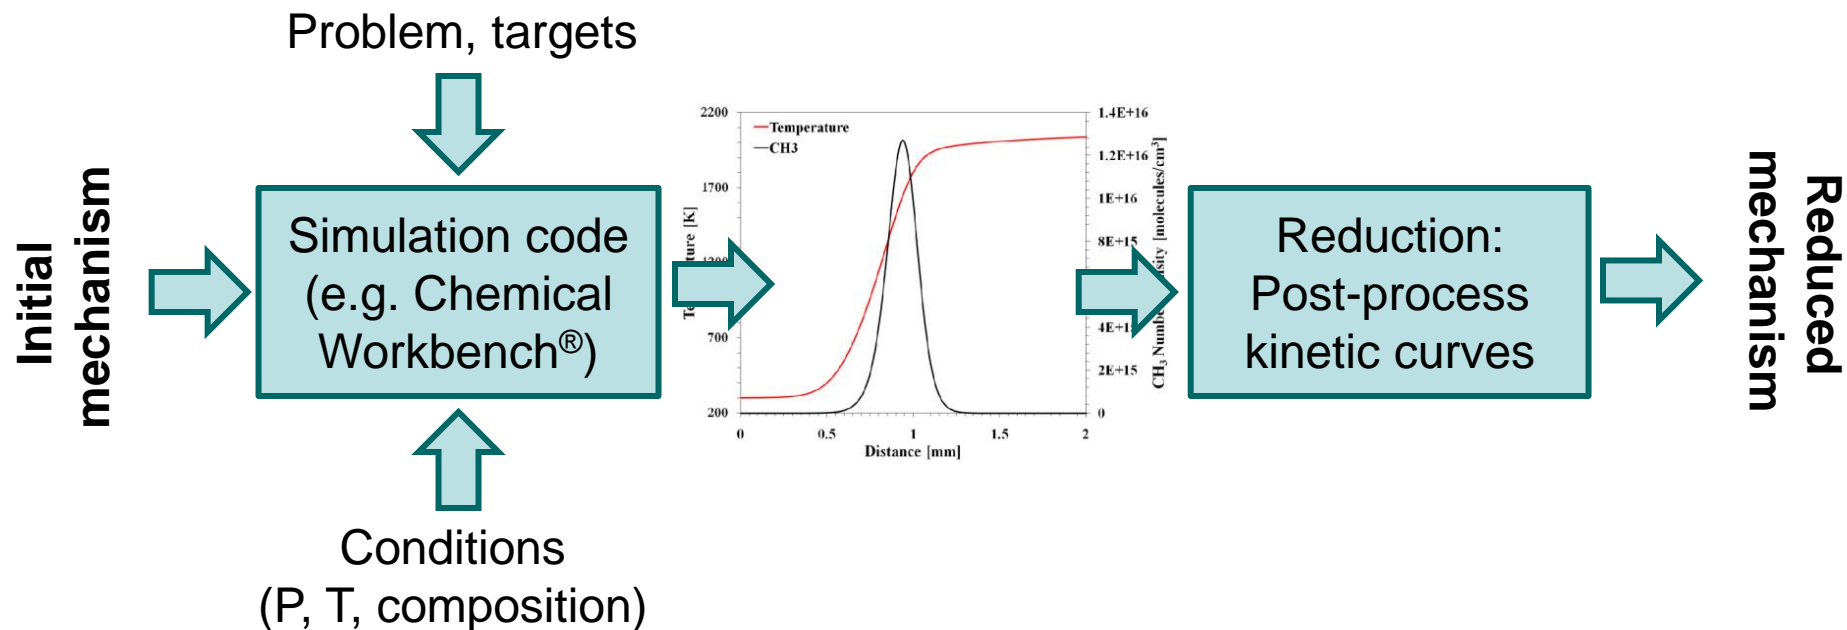

The size of the detailed combustion kinetics mechanisms for surrogates of real fuels makes impossible massive design studies with CFD tools

# What is mechanism reduction and how it works?

Type of the mechanism	Applications
<b>Detailed</b>	<ul style="list-style-type: none"><li>• Hundreds of spx, thousands of rxns for typical hydrocarbon fuels</li><li>• Supposed to work in a wide range of conditions</li><li>• But should be tested</li></ul>
<b>Skeletal</b>	<ul style="list-style-type: none"><li>• Tens of spx, tens/hundreds of rxns for typical hydrocarbon fuels</li><li>• Derived from detailed by removing redundant species and reactions</li><li>• Derived for narrow range of conditions, sometimes for specific problems</li><li>• Should be tested at desired range of conditions</li></ul>
<b>Reduced</b>	<ul style="list-style-type: none"><li>• Tens of spx, tens of rxns for typical hydrocarbon fuels</li><li>• Derived from detailed/skeletal by application of QSS or QE approximations</li><li>• Derived for narrow range of conditions, sometimes for specific problems</li><li>• Should be tested at desired range of conditions</li></ul>
<b>Global</b>	<ul style="list-style-type: none"><li>• Can not be directly derived from previous one, just a very simple model</li><li>• Can be applied in a very restricted range of conditions, only for one type of the problem</li><li>• MUST be tested every time before applications</li></ul>

# What is mechanism reduction and how it works?

Combustion process	Problem	Targets
<b>Self-ignition</b>	<ul style="list-style-type: none"> <li>Shock tube/RCM</li> <li>Flow reactors</li> </ul>	<ul style="list-style-type: none"> <li>Ignition delay time</li> <li>Profiles of species, temperature, pressure</li> </ul>
<b>Laminar Flame</b>	<ul style="list-style-type: none"> <li>Bunsen burner</li> <li>Flat flame burner</li> <li>Diffusion flame</li> </ul>	<ul style="list-style-type: none"> <li>Laminar flame speed</li> <li>Extinction strain rate</li> <li>Profiles of species, temperature, pressure</li> </ul>
<b>Turbulent flame</b>	<ul style="list-style-type: none"> <li>Jet stirred reactor</li> </ul>	<ul style="list-style-type: none"> <li>Concentrations of species</li> </ul>

# What is mechanism reduction and how it works?

Approach	Target for removal	Theoretical framework	Methods of reduction
<b>Element or Species flux analysis</b>	Species, reactions	Reaction paths	ROP, DRG, DRGEP
<b>Time-scale analysis</b>	Species, reactions	CSP	Time scale analysis, importance index analysis
<b>Sensitivity analysis</b>	Species, reactions	PCA	Species or rates sensitivity matrix analysis

# Best practice recommendations for mechanism reduction

## Test problem:

- Auto-ignition
- stoichiometric n-heptane/air
- 1 bar
- 650 – 2000K

## Kinetic mechanism:

- Curran, H. J., P. Gaffuri, W. J. Pitz, and C. K. Westbrook, "A Comprehensive Modeling Study of n-Heptane Oxidation" *Combustion and Flame* 114:149-177 (1998)

## Target:

- Ignition delay time
- 30% - maximum simulation error in comparison with detailed kinetic mechanism

# Best practice recommendations for mechanism reduction

## Setting numerical parameters for reduction method

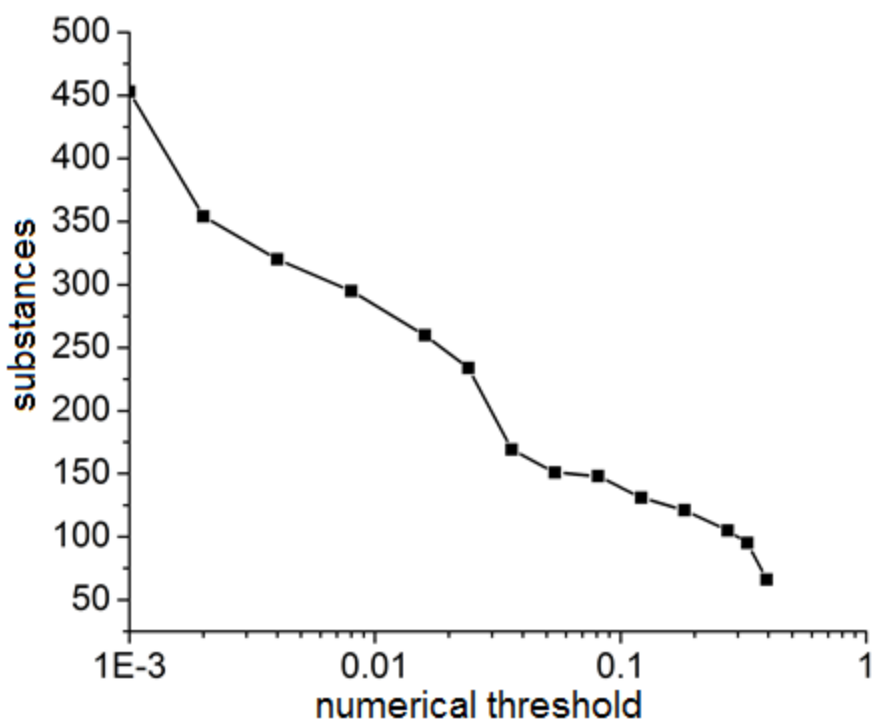

Threshold value	Iteration #1(err)	Iteration #2(err)	Iteration #3(err)
0.002	-207(err 0.02%)	-21(err 0.02%)	-2(err 0.02%)
0.004	-241(err 0.02%)	-28(err 0.02%)	-4(err 0.02%)
0.008	-266(err 0.02%)	-27(err 0.02%)	-4(err 0.02%)
0.016	-301(err 0.02%)	-25(err 0.02%)	-2(err 0.02%)
0.024	-327(err 0.03%)	-26(err 0.03%)	-1(err 0.03%)
0.036	-392(err 0.2%)	-36(err 0.3%)	-4(err 0.3%)
0.054	-410(err 1.7%)	-38(err 1.7%)	-1(err 1.7%)
0.081	-413(err 1.5%)	-33(err 0.7%)	-4(err 0.7%)

# Best practice recommendations for mechanism reduction

## Setting numerical parameters for reduction method

# Best practice recommendations for mechanism reduction

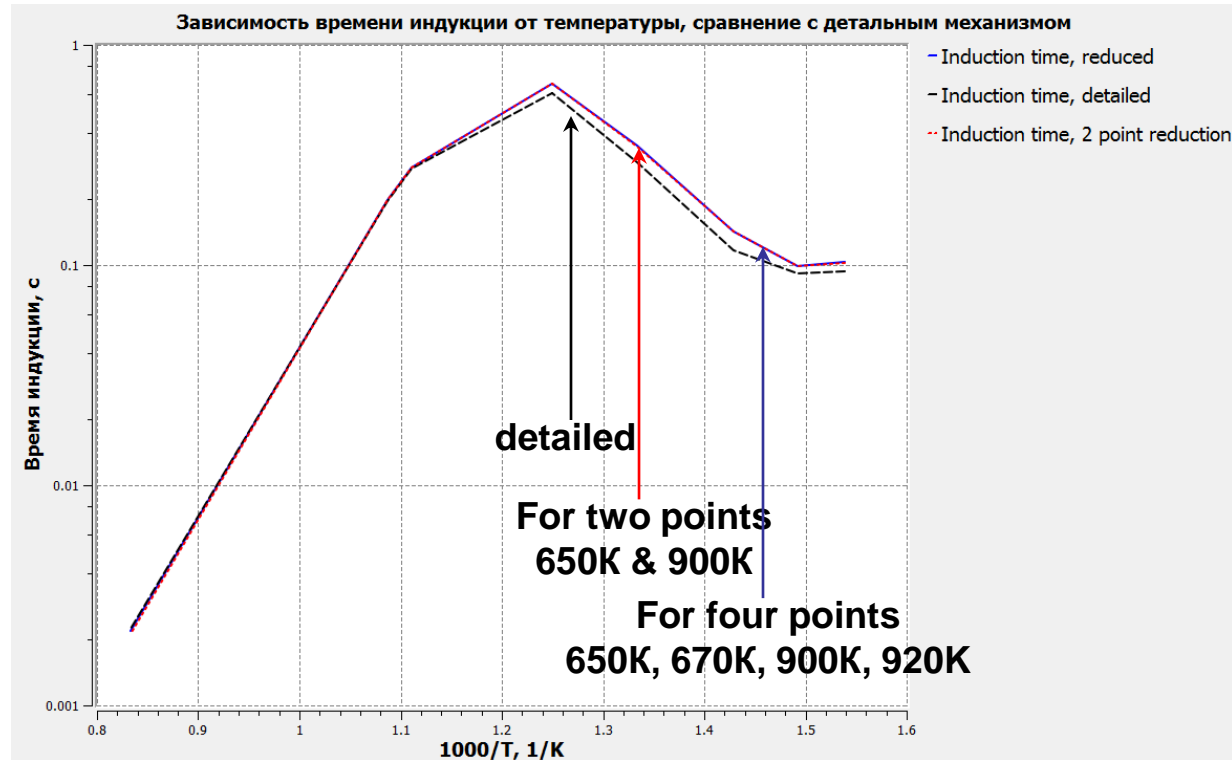

## Reducing mechanisms for a range of conditions

Low-to-high temperature ignition and NTC:  
How much points should we select for mechanism reduction, keeping the accuracy of reduced mechanism acceptable?

# Best practice recommendations for mechanism reduction

## Reducing mechanisms for a range of conditions

For efficient generation of the reduced kinetic mechanism in a range of conditions it is enough to take a single point in every characteristic interval of initial conditions.

For example, one point in low-temperature region and one point in high-temperature region

# Best practice recommendations for mechanism reduction

## Application of several reduction methods

### STEP 1

#### Reduction of redundant species:

- Only species, important at given conditions, will be present in mechanism
- Also a lot of reactions will be removed with species

Connectivity based methods:  
DRG, DRGEP

### STEP 2

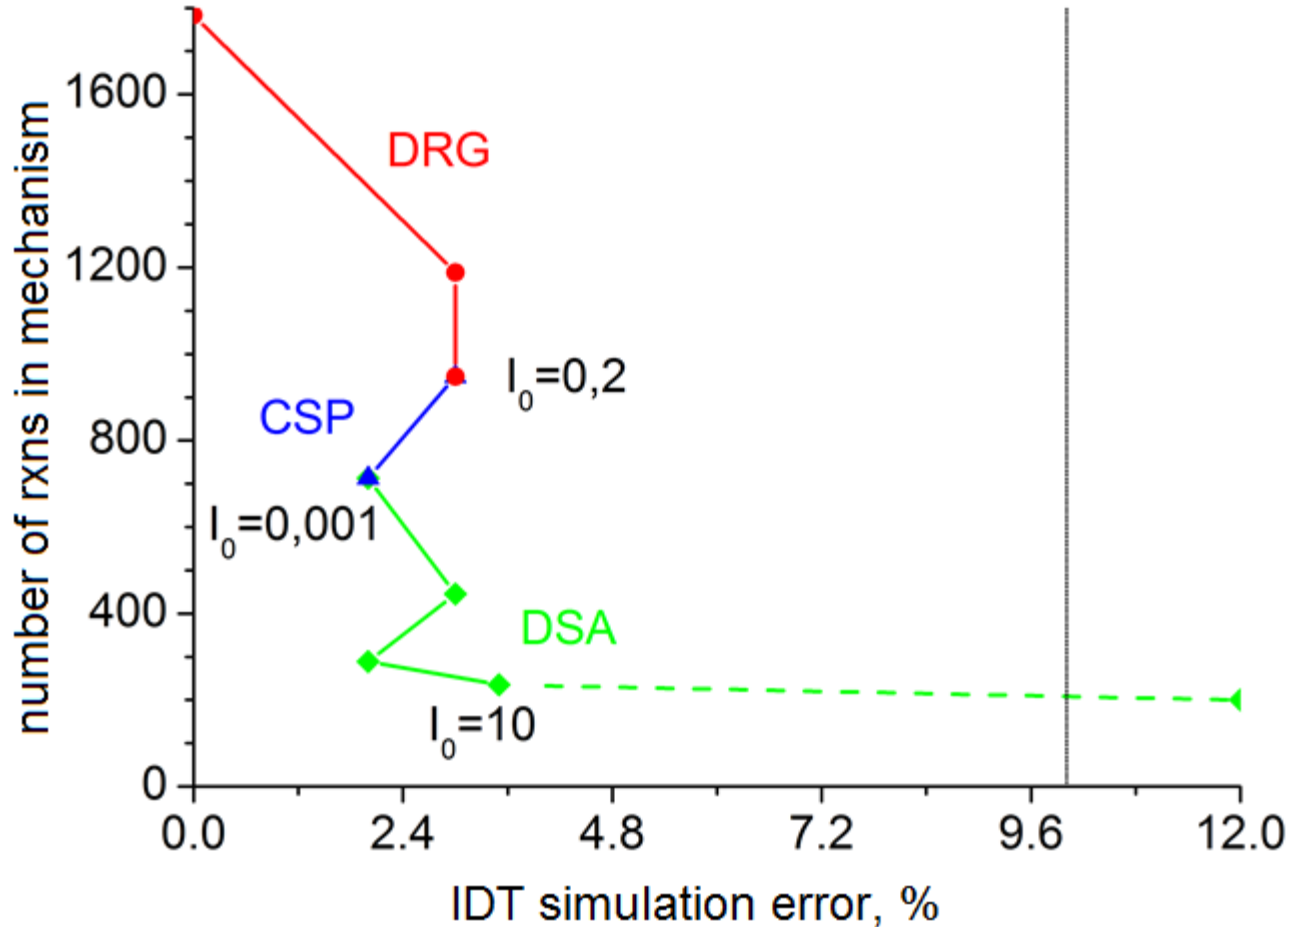

#### Reduction of redundant reactions

- Still redundant reactions can be removed from mechanism with important species

Time-scale analysis methods:  
CSP-based  
Sensitivity analysis methods:  
PCA-, PCAF-based

# Best practice recommendations for mechanism reduction

## Application of several reduction methods
